of authorization and user privileges. An administrator in a network environment might be able to read or write to a file, but not to delete it. This is an example of a role-based access control (RBAC) system.

Specific subtypes of authorization mechanisms include:

• Access Control Lists (ACLs)

~ Computer-based software that enforces

access control policies. ACLs are used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.

ACLs are typically used to control access to network resources, such as files, folders, and devices.
